Reinforcement	Improvement
I like the the hierachy and layout of your pages.	It would be cool if you could allow people to communicate on the app, to cheer artists on.
I really like the idea for the app.	It would be cool to be able to make collaborative playlists with other users.
You're keeping the app similar to apple music and Spotify	You would do something different than Apple Music or Spotify
There is recommended song/artist of the day	adding a random feature so you chose a genre and a random song gets played you could also have random genre aswell
I like the layout and the idea, the color scheme is cool too The overall description of their progress and	It would be fun if we can create playlists
challenges was clear The design considerations for a complex music application	Nothing to add so far
I like the app and the idea	It would be cool if you had a share playlist function
I like how the idea is able to allow many different people to add their own music.	It would be cool to use AI to come up with really good recommendations for everyone's music choice.
Your classifications/categorization idea for the songs looks well put and this will improve the organization in your app. Great functionality on your player screen! Great color combination!	You can add more colors to the login page so the background is not just white. Dark mode function should be the default, as it is in most streaming platforms. Implementing the login functionality? Add alternatives to this
I like how they add a forgot password option.	It was kind of hard to visualize, it would be cool if the boxes weren't just numbers.
Your presentation looks really good, I love the styling you guys did.	There was more detail for your screens, The blandness makes it difficult to imagine what theme the app would have. I wish that people who would use the platform
I like they have a pretty funny and realistic goal with something that they sound passion about which is music.	would get paid for streaming their music, but other than that it would be cool if we could see how many people stream a piece of music.

Sheet1

The mockups are logical and planned out well, I can see the concept you have for the app. I like the color scheme you chose (in the presentation, though the android studio one isn't bad either).	I notice that some of the page mockups have the footer, but not all of them. It would be good if the user had access to that throughout all of the app (ex. the search page doesn't currently have it).
How well defined your logo and vision of the project is.	If there was a way to pin artists to the main page like your playlist.
I like that you have official colors for your app already determined!	I wish that there was a play count for the songs and albums. GIVE US A QUEUE!!!!!!!!!!
Great pages and descriptions.	-
It looks to be a great music program, with a lot of ways for lesser music artists to get up there and share their talents.	Is there a way to make your own playlists?
I like the idea of supporting small artists and to give them a platform made for exposure.	It would be cool if you could filter artists based on location. If people want to discover any small artists or support local ones.

Unclear	Alternatives
I'm unsure about how this app can help artists continue making music, since they're not being paid.	Have you considered allowing people to add playlist.
I am curious about what steps users will have to take before being able to upload their music. Will you personally monitor uploads?	Have you considered what your color scheme will be?
What algorithm you'll use to suggest songs and playlists	How you are going to store the audio files or how you're going to get them?
Is absolutely anyone able to upload to the app or is there a verification to make sure someone isn't posting a troll post	what about if you can see the how popular the different songs are. Also on the login a forgot username in case someone somehow forgets it. Last thing as an easter egg for Damian you could add a secret way to listen to TWAP.
-	-
Nothing right now. It was clear	There are websites that you can find the color code for the colors you chose, instead of trying to guess it
not sure solid start!	n/a
Can anyone upload music or do they have to be confirmed first.	Have you considered having some sort of confirmation artists have to go through to ensure they are uploading real songs.
I think the purpose of your app is clear enough. Keep up the great work!	Could you add comment section for each song, would be fantastic!
I'm unsure on how recommended songs would works. Would it be based on their most listened genre or what's trending?	Have you considered giving the users the ability to create albums.
If its an audio app why is the title Japanese? Just sounds pretty weird since its not from Japan.	Make the settings slider smaller, have it take up at most 1/3 of the screen.
I'm unsure about the files how would they work would people just upload it and then other people can just stream it.	Have you considered maybe adding a customization for music videos.

Sheet1

What button do artists use to get to the "add song" page? How do users get to their account page/edit their account? You could add that as a button on either the top or bottom.	Have you considered whether every user can upload music or whether they need a certain role for permissions?
What would the section look like for creators to manage the music that they have already added?	Having the layout look a little bit different than Spotify, it looks really similar right now.
What does SKY stand for?!	Have you considered DELETING TWOP?!?!?!?
More about the General Application flow	Adding more visuals on the HomePage?
Everything made sense, but what are you doing to differentiate it from Spotify? I'm not sure if it was mentioned if users could	I have no other alternative suggestions.
songs that users like can be saved somewhere or if users can create their own playlists.	Will artists who post on the app have a different experience than users who just use the app to stream?
